

Errata and Clarification

The betting true count (BTC) which is utilized in the Uston Advanced point count system (UAPC) was inadvertantly described in an ambiguous manner in this manual. A clarification follows.

The BTC equals the running count adjusted for ace richness or - poorness and then converted to a true count by division by the number of half-decks remaining to be played. See the following formula:

$$\text{BTC} = \frac{\text{running count} + 3 \times (+ \text{\#aces rich or } - \text{\#aces poor})}{\text{number of half-decks remaining}}$$

The BTC is utilized in determining the bet size. Ignore statements on pp. 46-7 which refer to the "ace adjusted running count" and insert BTC in its place. UAPC players should bet the BTC-1 in betting units.
